FE: iso3c		X	X	X	X
FE: year			X	X	X

Notes: This table responds to the portfolio-composition interpretation of dark matter. The dependent variable is annual dark matter exports under the H&S 5% method in columns (1)–(3), and the component-specific dark matter stock under Scenarios A and B in columns (4)–(5). The regressors are gross external asset and liability positions by asset class, expressed as percent of GDP. Standard errors are heteroskedasticity-robust in column (1) and clustered by country in fixed-effect columns. * p<0.10, ** p<0.05, *** p<0.01.
