

Table 3: Extension 2b — VIX Sensitivity of Dark Matter Exports: Component-Specific Method (1990–2022)

	(1) A: pooled	(2) A: country FE	(3) A: two-way FE	(4) B: two-way FE
(Intercept)	1.3731 (1.8755)			
$\Delta \log(\text{VIX})$	-3.5888 (5.4780)	-4.2230 (5.2996)		
$\Delta \log(\text{VIX}) \times \text{Safe haven}$	-16.6695 (13.4033)	-14.3305 (16.1621)	-13.4321 (16.4316)	-17.7581 (22.9313)
$\Delta \log(\text{VIX}) \times \text{OPEC}$	4.1874 (12.2683)	7.2681 (8.8356)	6.9479 (8.5949)	10.1494 (9.3751)
Country FE	No	Yes	Yes	Yes
Year FE	No	No	Yes	Yes
FDI liabilities / GDP	-0.1032 (0.1200)	-0.1522*** (0.0570)	-0.1558*** (0.0581)	-0.1154** (0.0456)
FDI assets / GDP	0.0996 (0.1261)	0.1388*** (0.0386)	0.1413*** (0.0390)	0.0985*** (0.0270)
Num.Obs.	2203	2203	2203	2203
R2	0.017	0.039	0.055	0.047
FE: iso3c		X	X	X
FE: year			X	X

Notes: Dependent variable: annual dark matter exports divided by GDP. Columns (1)–(3) use Scenario A from Part II Section 2; column (4) uses Scenario B. The component-specific method capitalises each NII component using asset-class-specific discount rates, then computes annual implied CA from the change in component-specific NFA. In two-way FE columns, year fixed effects absorb the aggregate VIX level. Standard errors clustered by country where fixed effects are used. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.
