

Table 5: Extension 2d — VIX, Safe Havens and the Global Financial Crisis Split

	(1) 5% Pre-GFC	(2) 5% Post-GFC	(3) Comp. A Pre-GFC	(4) Comp. A Post-GFC	(5) Comp. B Post-GFC
$\Delta \log(\text{VIX}) \times \text{Safe haven}$	-44.5401*** (15.7398)	-24.2679** (11.1067)	-37.8039*** (13.2434)	-9.1574 (20.3016)	-15.3124 (27.7679)
$\Delta \log(\text{VIX}) \times \text{OPEC}$	9.2658 (21.7806)	-1.9113 (5.1643)	-6.0686 (21.2983)	11.3433 (8.9970)	15.5411 (10.4534)
FDI liabilities / GDP	0.1025 (0.1188)	-0.0105 (0.0350)	0.7335 (0.6997)	-0.0707* (0.0415)	0.0028 (0.0150)
FDI assets / GDP	-0.0952 (0.0935)	0.0046 (0.0193)	-0.6159 (0.5569)	0.0742** (0.0289)	0.0015 (0.0114)
Country FE	Yes	Yes	Yes	Yes	Yes
Year FE	Yes	Yes	Yes	Yes	Yes
Num.Obs.	1269	1151	1052	1151	1151
R2	0.077	0.149	0.145	0.070	0.070
FE: iso3c	X	X	X	X	X
FE: year	X	X	X	X	X

Notes: This table tests whether the VIX-safe-haven relationship changes before and after the Global Financial Crisis. Columns (1)–(2) use the original H&S 5% method. Columns (3)–(5) use the component-specific method from Part II Section 2. All regressions include country and year fixed effects. Since year fixed effects absorb the aggregate VIX level, identification comes from the differential response of safe havens and OPEC countries to changes in VIX. A negative post-GFC safe-haven coefficient is consistent with an exorbitant-duty interpretation: safe havens may provide insurance or liquidity in crises rather than immediately earning higher annual dark matter exports. Standard errors clustered by country. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.
