Notes: Dependent variable: cumulative dark matter exports over 1980–2022, divided by end-year GDP. The intangible index is the row mean of four standardised components: R&D/GDP, log resident patent applications, log high-technology export share, and log ICT service exports. At least two components are required per country-year. All variables winsorised at the 1% level. * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$.
